

Robotic Low Anterior Resection- Step by Step

SHERIEF SHAWKI, MD, FACS, FASCRS

CONSULTANT

*ASSOCIATE PROFESSOR, MAYO CLINIC COLLEGE OF
MEDICINE*

*CHAIR, INNOVATION
DIVISION OF COLON & RECTAL SURGERY*

Fundamental concepts

- Identify anatomy
- Identify pathology
- Colon & rectum
 - occupy multiple quadrant
 - Redundant
- Return to embryological position
- Set up, ergonomics of traction-Counter-T^UT^D

LAR: Main Steps

- Medialize sigmoid and left colon
- Identification of superior hemorrhoidal / IMA
- Vascular control
- Splenic flexure mobilization
- Divide mesentery towards future transection point
- Rectal dissection
- Stapling
- Anastomosis

Medialization of sigmoid and left colon

- Embryological midline position
- Lateral to medial
- Medial to lateral
- Secure left ureter and hypogastric nerves
- Keep uretero hypogastric fascia intact
 - => access left side of upper pelvis in correct plane

Identification of superior hemorrhoidal vessels and IMA

- Put them under tension (set-up)
- Follow Caudate => TME
- Trace cephalad => IMA
- Secure hypogastric nerves and left ureter

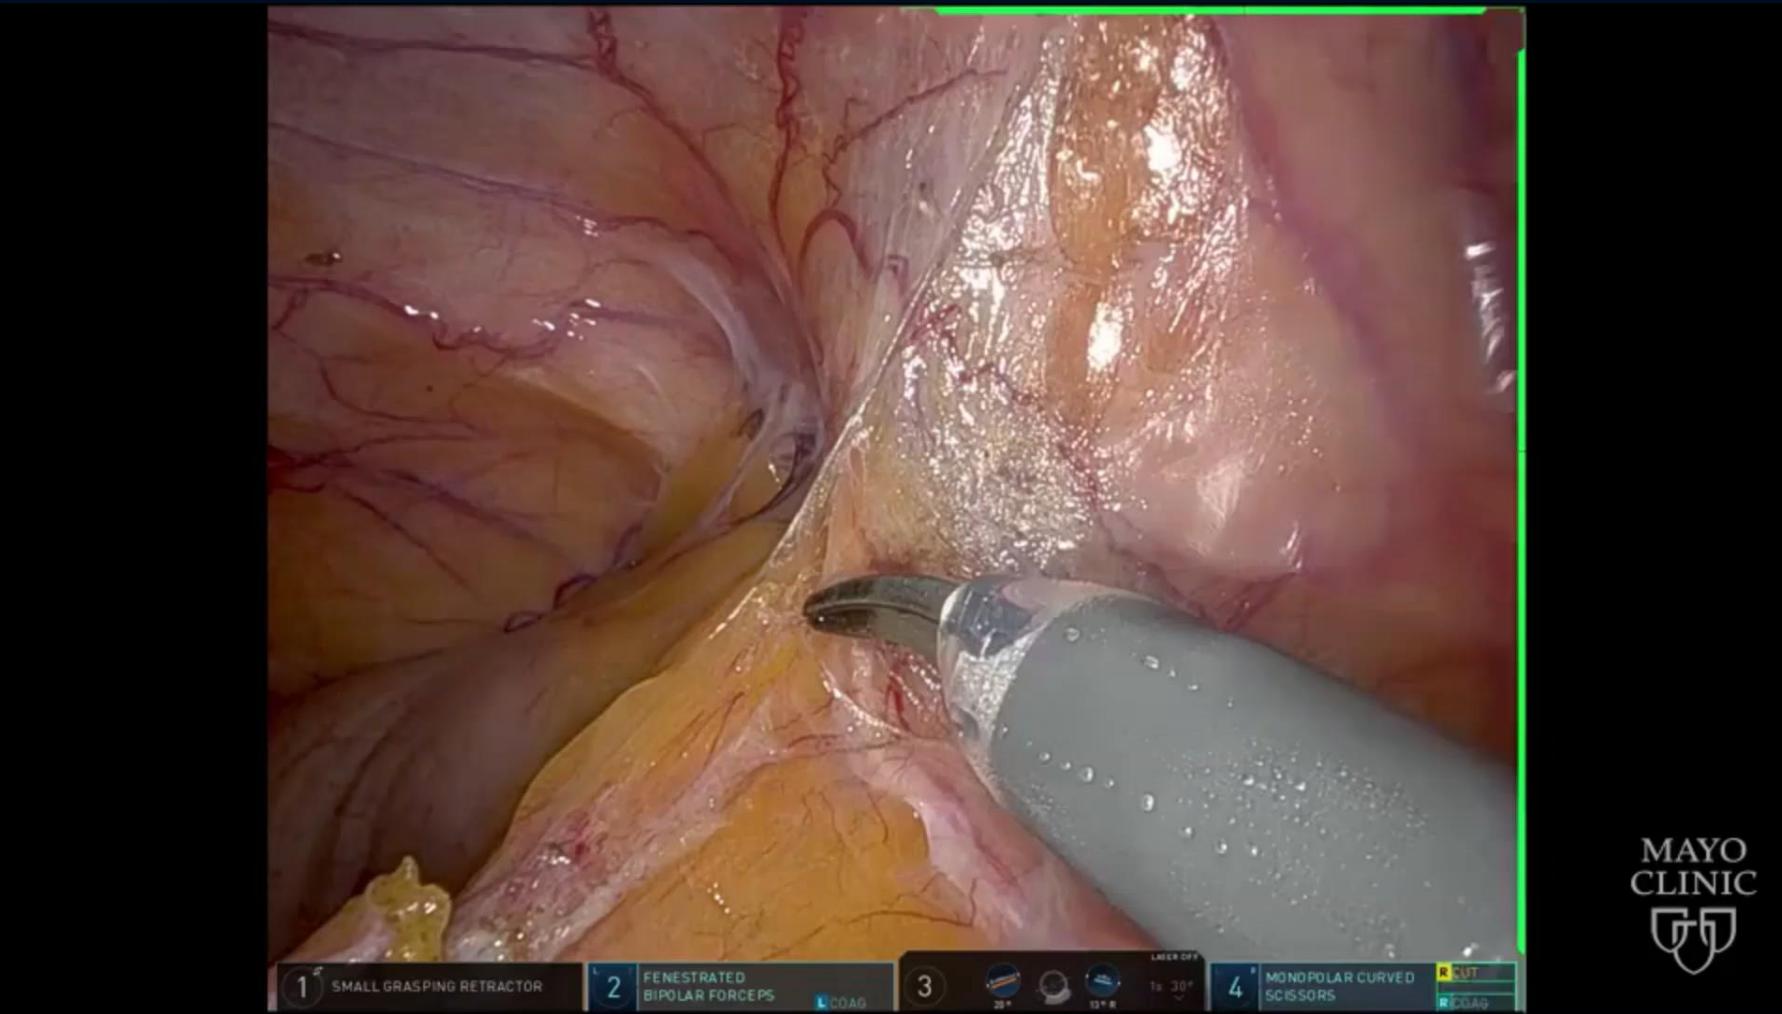

Vascular control

- IMA
 - => high vs. Low ligation
- IMV
 - Low ligation : every case
 - High ligation: for reach
 - Combined with splenic flexure mobilization

Divide mesentery towards the future transection point

- Intra-corporeal procedures
 - Ability to extract; suprapubic location
 - Avoid tearing
- Low division of IMV
- Division of left colic vessels
- Division of marginal vessel
- ICG (before anastomosis)

Splenic Flexure Mobilization

- For reach and tension free colonic conduit
 - Will start with if needed
- Release attachments with:
 - Spleen & Diaphragm
 - Pancreatic body
 - Divide IMV @ inferior border of the pancreas

IMV, Pancreatic attachments

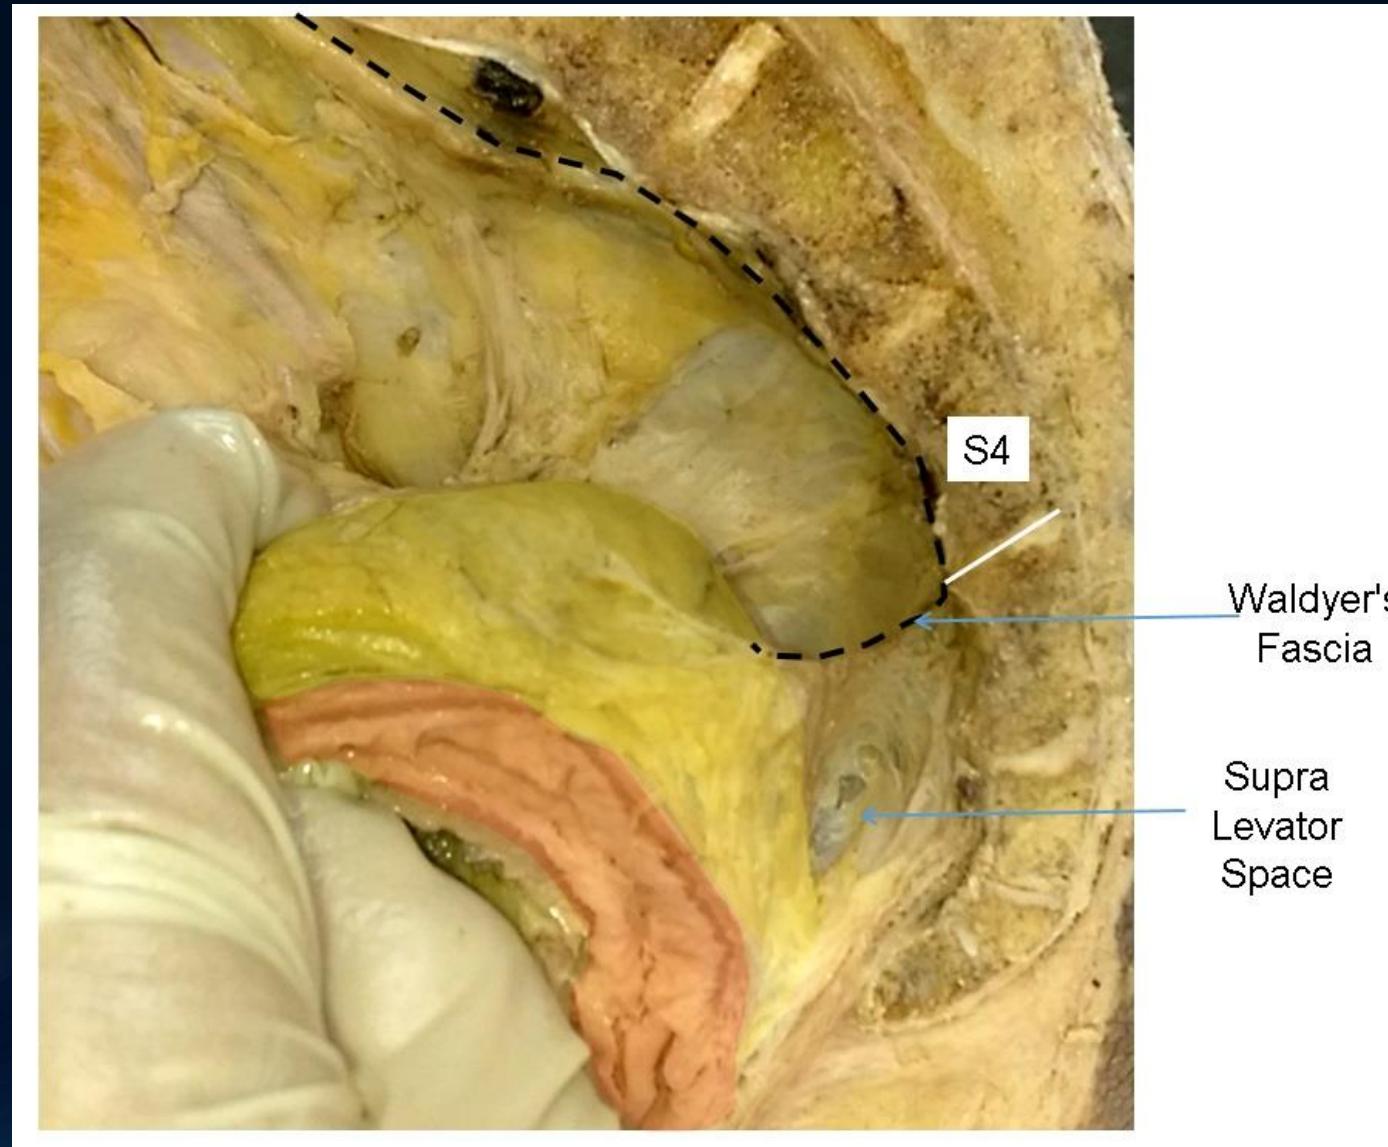

MAYO
CLINIC
 CLINIC

Rectal dissection

- Set-up
- Ergonomics of pelvic traction/counter T
- TME plane
- Extent of dissection
 - TME specific vs. complete mesorectal excision
- Define distal transection point
 - Distal margin + safe margin
 - Better stapling
 - Avoid injuries
- Clean the rectum
 - Avoid angulation

Dissection Strategy

- Posterior dissection all the way till the levator hiatus
- Extend bilaterally as much as possible following the plane
- Lateral pararectal attachments – secure NVB
- Enter the anterior plane
- Release distal pelvic floor attachments
- Middle rectal vessels – if present
- Access Levator hiatus
- Inter-sphincteric dissection if needed

Rectal Transection & Anastomosis

- The rectum must be Straight structure
- Mesenteric division => perpendicular
 - Avoid devascularization (transmural supply)
- Staple at any angle (as long as you are comfortable)
- Tension BEFORE anastomosis
- Colonic conduit orientation
- Evaluate anastomosis integrity
